

Sustainable Urban Planning Strategies for Cities in Karnataka

Sustainable Urban Planning Strategies for Cities in Karnataka

Part 1

Developing a Proof of Concept Urban
Observatory for Karnataka

Part 2

Pre- Feasibility Assessment of Sanitation
Options for Cities

Part-I

Urban Observatory for Karnataka

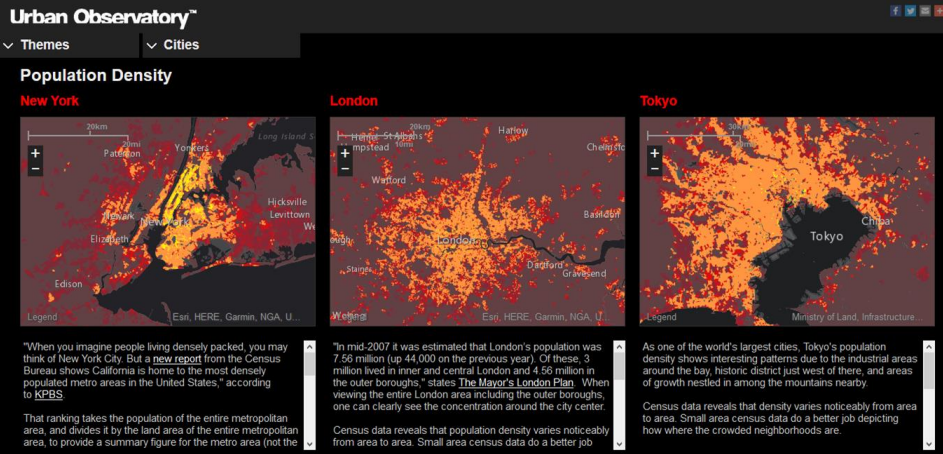

Urban Observatories help address urban challenges by:

- Providing better insights into a problem or phenomenon
- Identifying it's intensity, pattern, cause-effect loop to design appropriate response strategies

Objective of an UO: Geo-spatial data analyses and visualisation to enable data-driven decision-making

Urban Observatory Project by ESRI

Compare and contrast maps of cities around the world

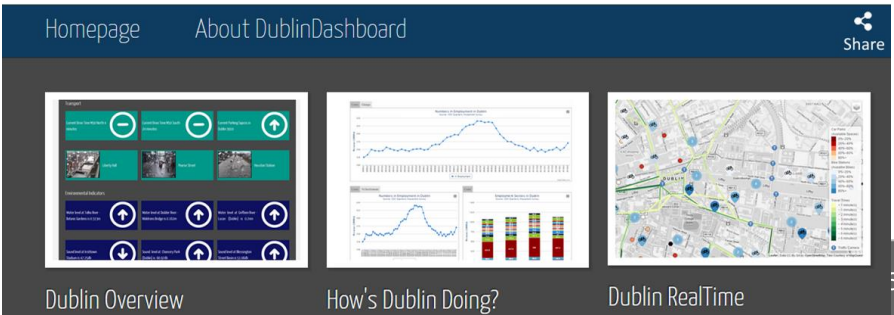

Dublin Dashboard by Dublin City Council

Evidence informed analysis for decision making

City Dashboard for cities in UK

Aggregates simple spatial data for cities in UK

Urban Observatory at Newcastle

Aggregates data on air quality, traffic, from sensors

Integrated Command Control
Centre, Vizag

Smart City Centre/ Integrated Command
Control Centre, Madhya Pradesh

The UO platform developed by CSTEP makes Karnataka one of the first States in India to have a functioning observatory platform at a state level

- Indian Urban Data Exchange (IUDX), 2018
- DataSmart Cities Initiative (under preparation)
- National Urban Observatory

Features and Functionalities

- **Collates data**

Ability to access and collate reliable data through crowdsourcing and from third party database and portals

- **Analyses data for informed decision making**

Ability to generate spatial and temporal analysis and visualise data for informed decision making

Noise pollution monitoring

Air/ water pollution mapping

Pothole monitoring

Mapping direction of city's built growth

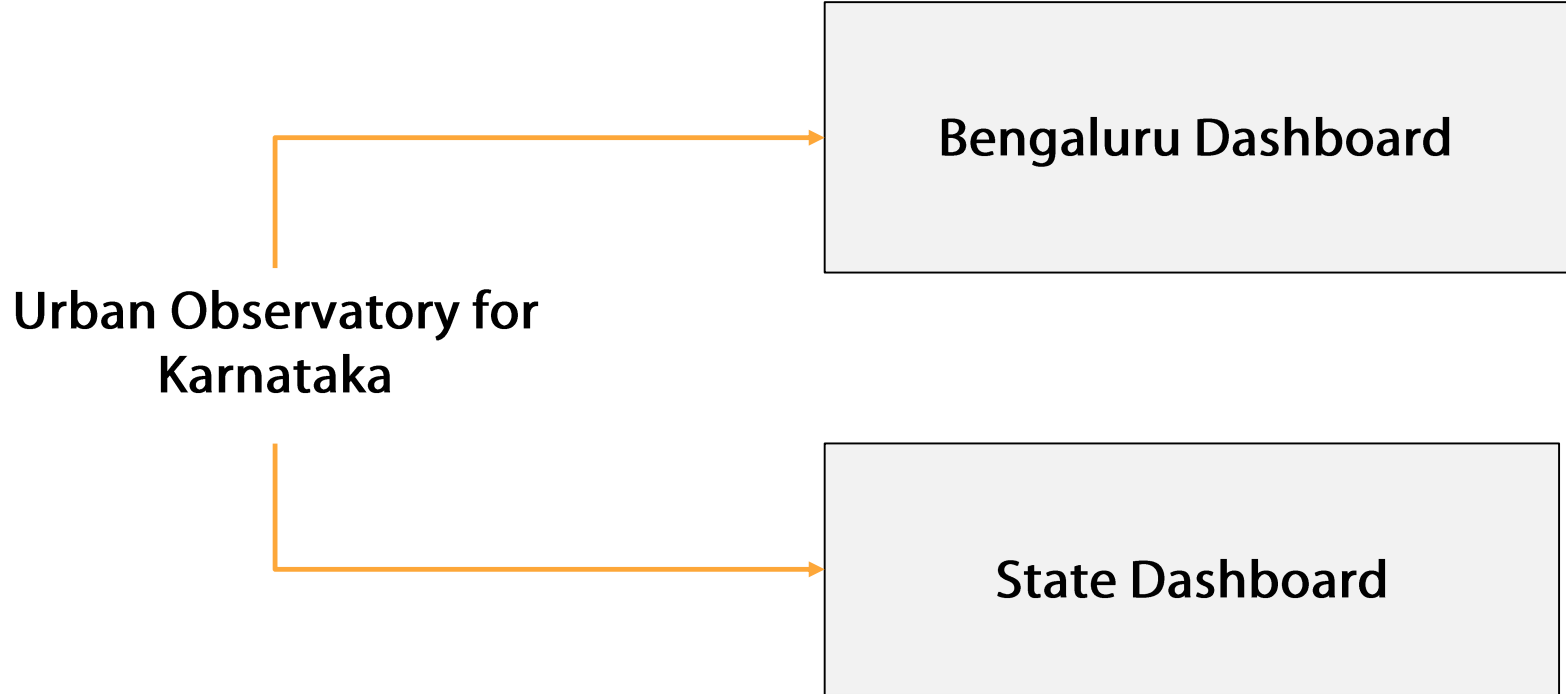

Assessing future infrastructure/ service delivery needs for a city

Assessing impact of new development /investments

Tracking compliance with city master plans

Aid in value- capture financing in a city

Urban Observatory for Karnataka: Components

Bengaluru Dashboard

Map noise pollution levels in different parts in Bengaluru in different times

Noise levels collected through *Shabda* app developed by CSTEP

Collation with noise levels reported by KSPCB monitoring stations

Analyses to show:

- Point wise noise pollution levels on a map
- Temporal variation of ward-wise noise levels
- Spatial analyses for noise levels in silent zones

Description

Silence zone is an area comprising not less than 100 meters around Hospitals, Educational Institutions, Courts, Religious places or any other area which is declared as such by the competent authority.

The map highlights silent zones around hospitals that exceed the permissible noise limits. The permissible limits for day time and night time as per Karnataka State Pollution Control Board (KSPCB) are given below.

Category of Area	Day limit dB(A) Leq* (6 a.m. to 10 p.m.)	Night limit dB(A) Leq* (10 p.m. to 6 a.m.)
Silent Zone	50	40

*Leq is equivalent continuous sound level

Where is your city growing?

The images in this page present the ward-wise additions (in sq. m.) for which building permissions are issued in a city during a selected time period**.

The objective is to visualize and compare the emerging spatial direction of built growth in a city over time. The two parallel tiles shown help in comparison of spatial growth direction between two cities.

The information on building permission is sourced from the NIRMANA online application developed by the Municipal Reforms Cell, Government of Karnataka.

Select the cities and move the slide bar to view the area additions during selected time period. Click on a ward to view the information for the ward.

**The time period used here are the four quarters in a year (Q1: January-March, Q2: April- June, Q3: July-September, Q4:October-December).

2016 2017 2018

- The Proof-of-Concept Urban Observatory platform demonstrates features of data collation, analysis and visualisation through two selected themes/ functionalities.
- These features can be extended to other themes for all cities in Karnataka.

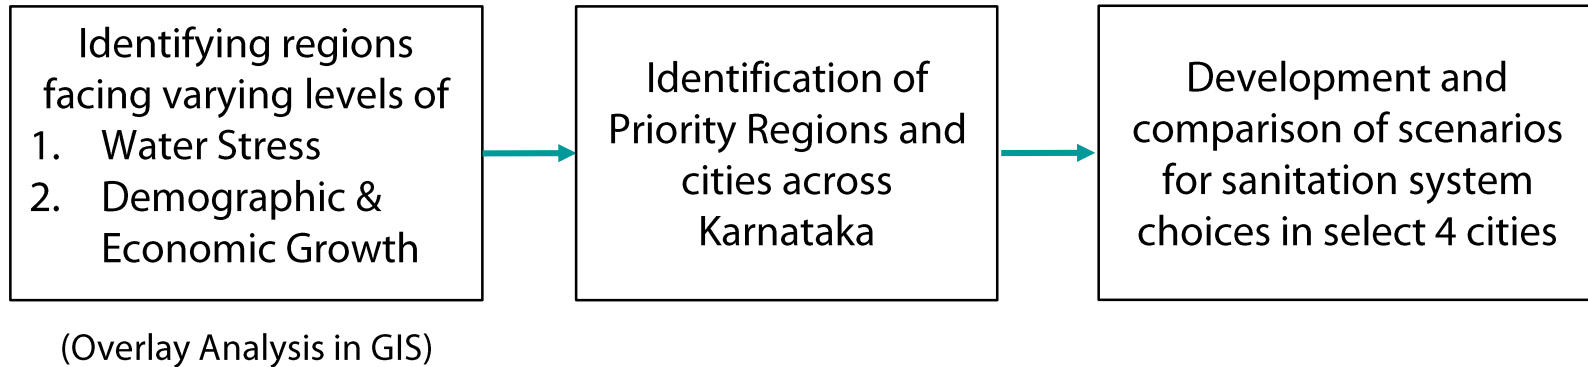

Part-II

Pre- Feasibility Assessment of Sanitation Options for Cities

- GoK policies for Sanitation
 - Urban Waste Water Reuse Policy: Preparation of IUWM plans for 10 cities
 - Faecal Sludge and Septage Management Policy: Phase-wise implementation of FSSM in combination with networked systems, with first phase focussing on AMRUT cities
 - State Sanitation Strategy: 100% sanitation coverage in all cities

To facilitate implementation of UWWR Policy, FSSM Policy and the State Sanitation Strategy in an integrated manner

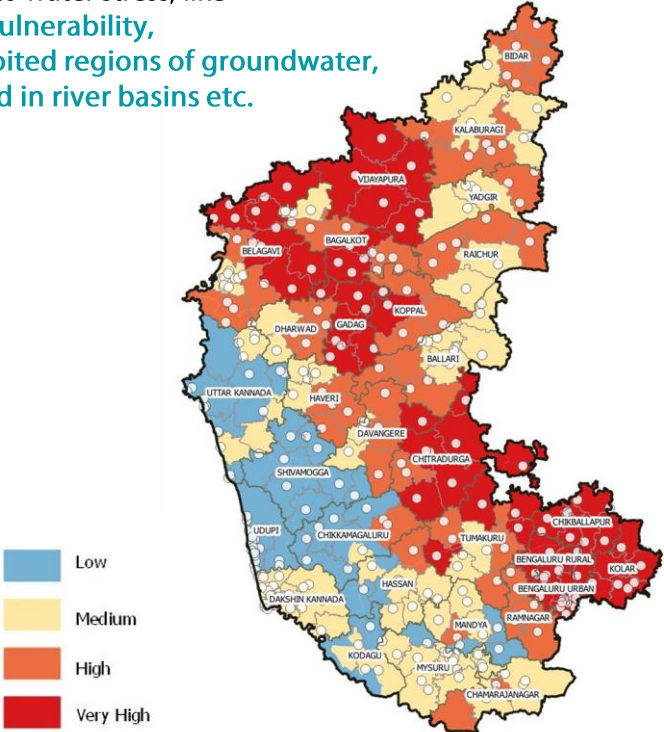

1. Identify cities and regions which would require priority attention due to high water-stress and growth pressure by 2020
2. Demonstrate a pre-feasibility assessment methodology for choice of sanitation systems for select cities which can help achieve objectives of stated policies

Regions facing varying levels of water stress

Weighted overlay analysis of possible criteria contributing to water stress, like

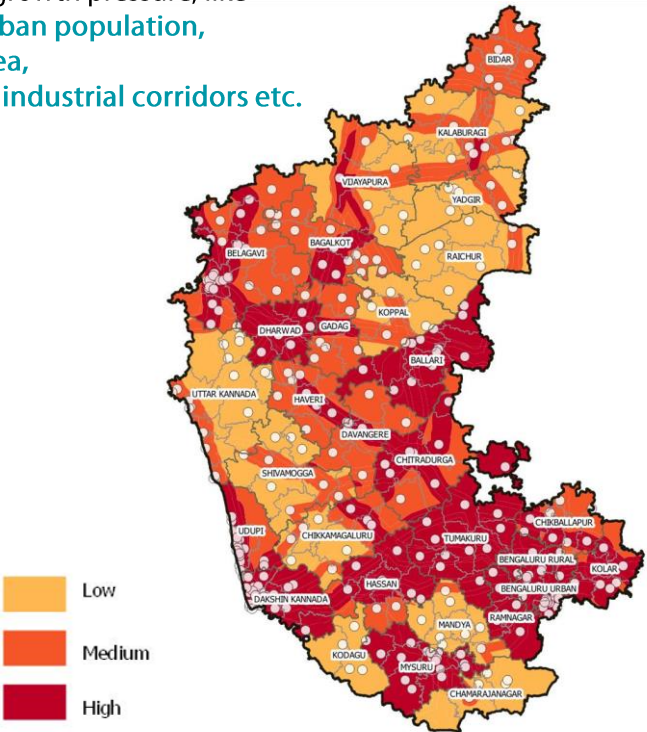

- drought vulnerability,
- over exploited regions of groundwater,
- water yield in river basins etc.

Regions facing varying levels of growth pressure

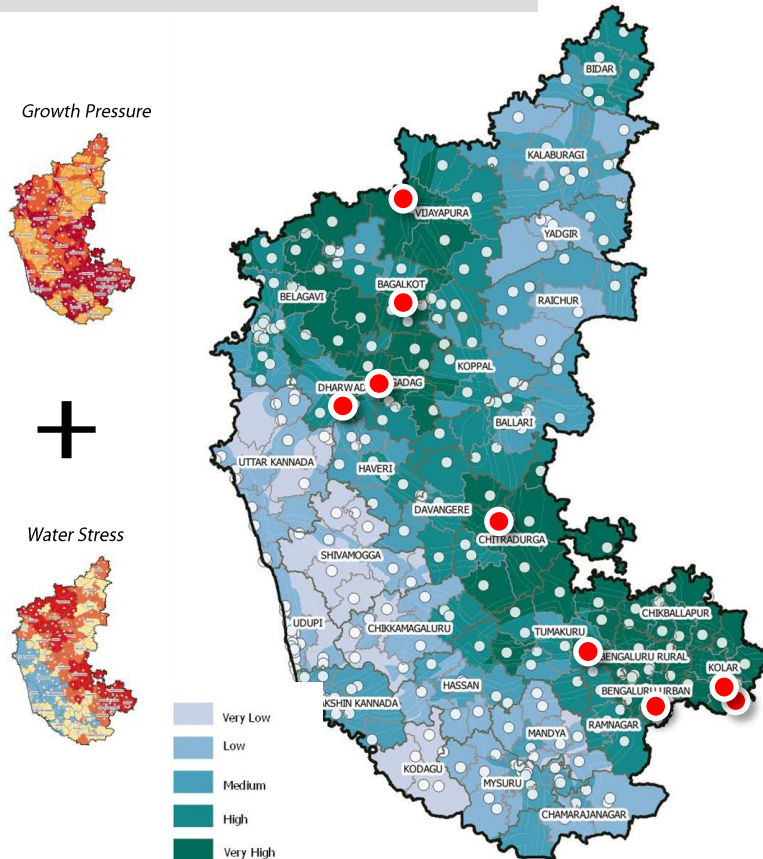

Weighted overlay analysis of possible socio-economic criteria contributing to growth pressure, like

- growth of urban population,
- industrial area,
- proximity to industrial corridors etc.

Results: Priority regions and cities

Priority Regions

- High priority regions lie mostly along the Bengaluru-Mumbai Economic corridor
- 8 class-I and 12 class-II are located in high-priority regions

Class 1 cities	Class 2 cities
Bengaluru, Hubballi-Dharwad Vijayapura, Tumakuru Gadag, Robertsonpet Chitradurga, Kolar, Bagalkot	Doddaballapur, Gokak, Chintamani, Chikkaballapura Nipani, Tiptur, Sira, Mulbagal Hosakote, Hiriyur, Challakere, Sidlaghatta

Sanitation pre-feasibility assessment

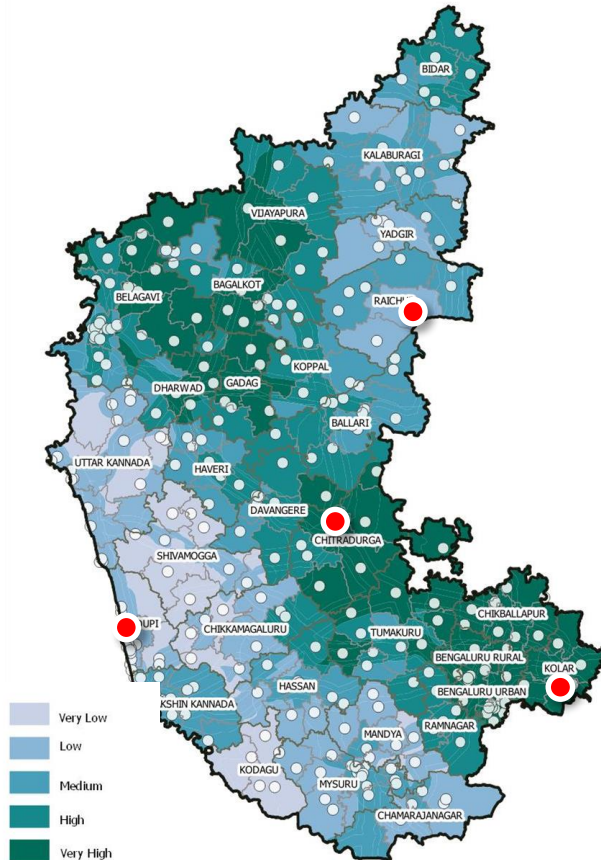

Selection of cities

2 cities in very high water stressed region

- Kolar
- Chitradurga

2 cities in different geographic regions

- Udupi (Coastal city),
- Raichur (Northern Karnataka region)

Sanitation pre-feasibility assessment: Scenarios

- Three scenarios were designed for each city:
 - **Scenario 1:** Decentralised FSSM system using natural treatment technologies
 - **Scenario 2:** Decentralised FSSM system using mechanised treatment
 - **Scenario 3:** Centralised networked systems
- Techno-economic analysis done for each scenario

Sanitation pre-feasibility assessment

Baseline parameters

Baseline parameters	Kolar	Raichur	Chitradurga	Udupi
Estimated present population (2018)	1,69,207	2,84,221	1,67,975	1,93,196
No. of households	36,632	55,996	36,235	42,402
% of homes with toilets and storage	22%	20%	33%	82%
% of homes with toilets (but no storage/collection)	3%	5%	3%	0%
% of homes with sewerage system	68%	34%	51%	15%
% of homes with decentralised system	0%	0%	0%	0%
% of homes with no toilets	7%	41%	13%	3%

Guiding Assumptions

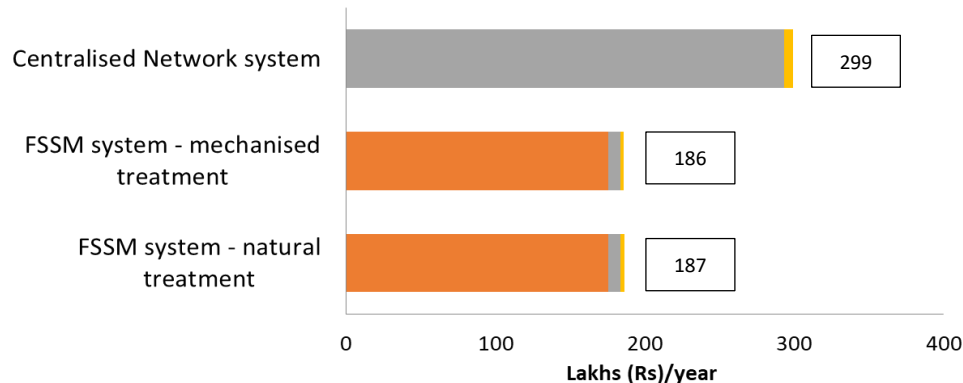

- Systems and their technologies chosen based on city's physiology
- Unit costs, treatment efficiency and resource requirements vary across technologies
- Estimated plant capacity, water required vary based on type of system
- In each scenario, selected system serves 100% of the unserved population

Capital Costs

	FSSM system - natural treatment	FSSM system - mechanised treatment	Centralised Network system
Land requirement for treatment (acres)	0.10	0.04	2.03
Treated wastewater generated (tonne/yr)	5,805	5,805	7,05,138
Treated sludge generated (kl/year)	6,530	6,530	1,322

Operation & Maintenance Costs

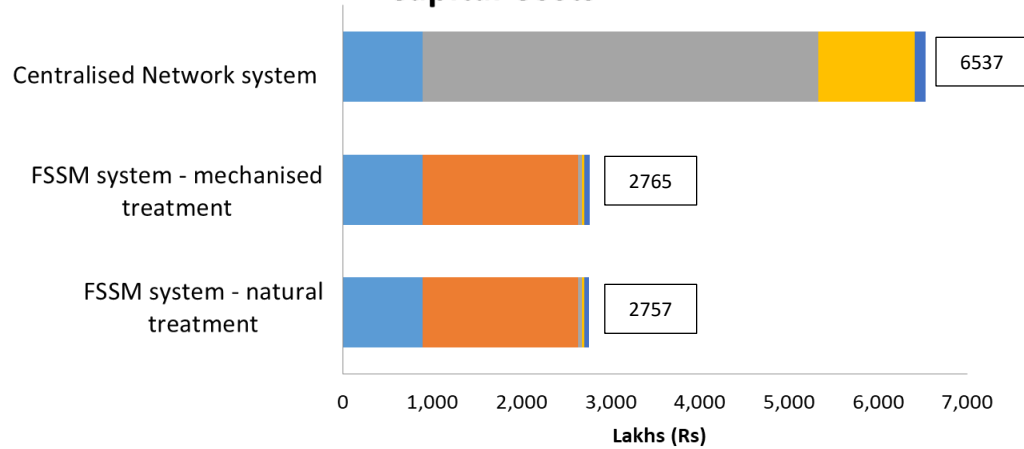

Legend

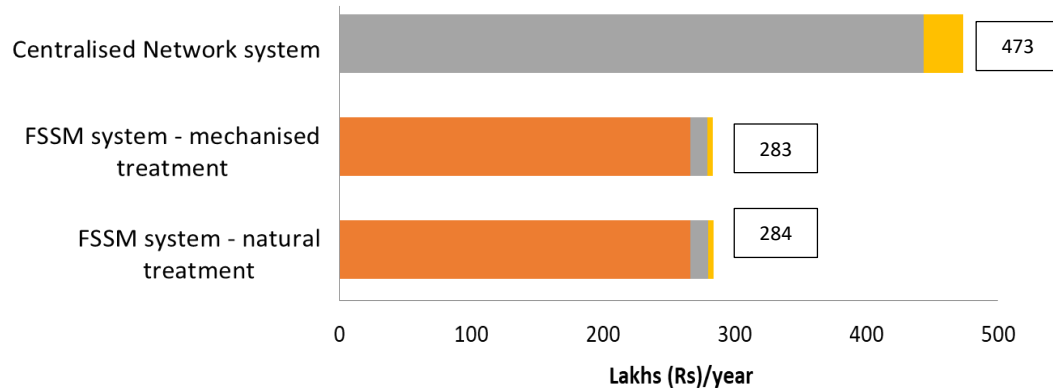

Results: Chitradurga

Capital Costs

	FSSM system - natural treatment	FSSM system - mechanised treatment	Centralised Network system
Land requirement for treatment (acres)	0.32	0.05	1.84
Treated wastewater generated (tonne/yr)	13964	13964	22,24,979
Treated sludge generated (kl/year)	15,710	15,710	4,172

Operation & Maintenance Costs

Legend

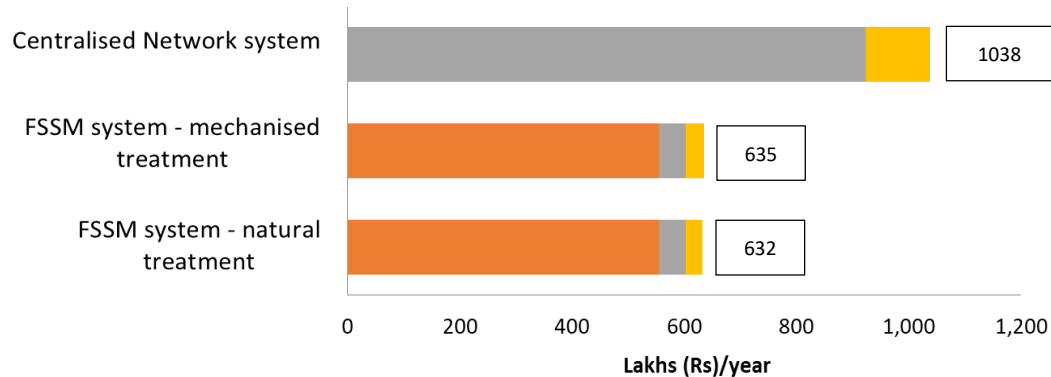

Capital Costs

	FSSM system - natural treatment	FSSM system - mechanised treatment	Centralised Network system
Land requirement for treatment (acres)	1.04	0.19	6.21
Treated wastewater generated (tonne/yr)	59,145	59,145	75,61,889
Treated sludge generated (kl/year)	66,539	66,539	14,179

Operation & Maintenance Costs

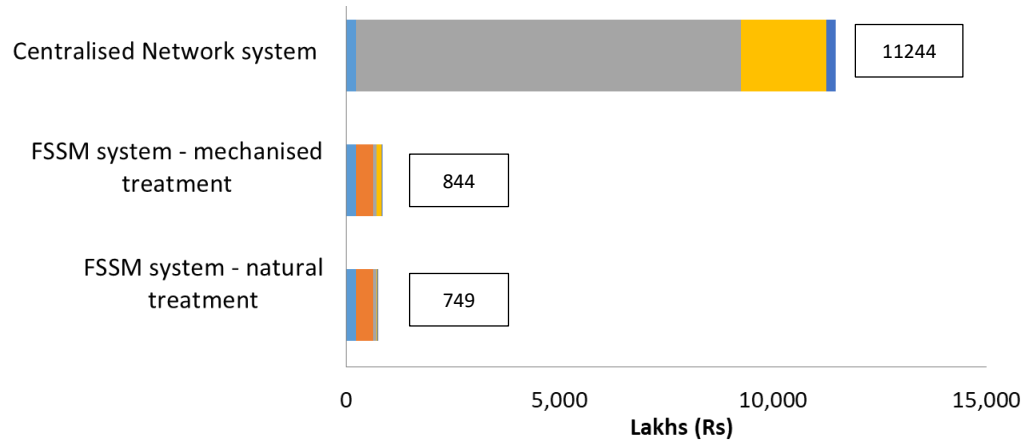

Legend

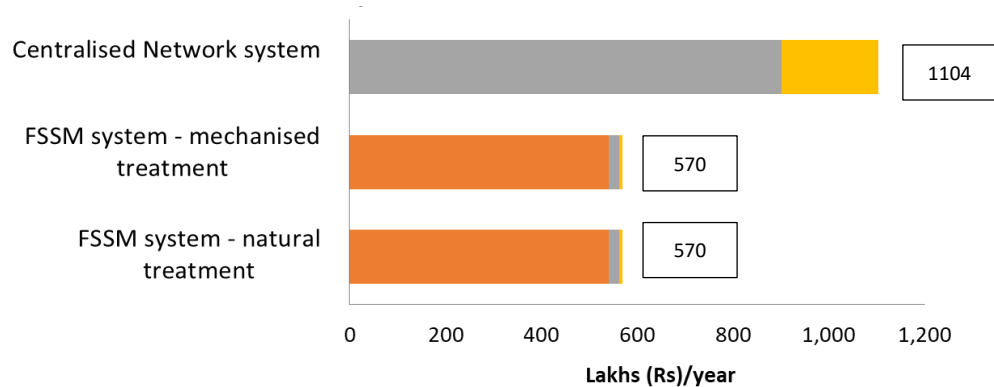

Results: Udupi

Capital Costs

Operation & Maintenance Costs

	FSSM system - natural treatment	FSSM system - mechanised treatment	Centralised Network system
Land requirement for treatment (acres)	0.19	0.09	4.86
Treated wastewater generated (tonne/yr)	22,572	22,572	46,08,185
Treated sludge (generated (kl/year)	25,394	25,394	46,08,185

Legend

Recommendations & Conclusions

- Decentralised FSSM systems are recommended for water-stressed regions
- Lower land and water requirements for Decentralised FSSM systems
- Need to invest in greywater management systems alongside FSSM
- Potential for revenue for networked systems from waste water reuse
- A list of strategies and technologies can be accessed in a toolkit format, available in the following link (<http://cstem.cstep.in/uoapp/#/state>)

Thank You
